**Tower building Activity**

**Introduction:** Through your research, you have learned that a triangle is the strongest geometric shape. You have also learned that a truss is two or more triangles connected together in a straight line. For this engineering activity, you will need to design and build a vertical truss that fits all of the design criteria and supports the most weight.

**Materials**
- One piece of balsa wood 1/8” x 1/8” x 36”
- 60 toothpicks
- Limited amounts of glue….excessive use of glue will be disqualified and result in a poor grade.

**Design**

The groups must design a full scale drawing on a piece of graph paper. The drawing must:
- Be in pencil
- Use a straight edge
- Show the thickness of the materials (Note A on the next page)
- Show a center line: the base of the tower must be at least 1” from either side of center (Note B on the next page). And the top of the tower must be at least ½” from either side of center. (Note C on the next page)
- HINT: A symmetrical design will work best and be the strongest
- NOTE: A toothpick is 2 5/8” long

**Tower constraints**
- The tower must be between 6” and 8” tall
- The tower must have three or four sides.
- The tower must be able to span a 2” diameter hole at the base
- The tower must have a 1” hole at the top
Research possible designs for your structure and make four possible prototypes. Write a brief statement as to why this structure will be a successful design. Choose one of the prototypes and develop a scale model on the back of this paper to scale using a ruler. The quality of the drawing is extremely important for this project.
